

OUR PIPELINE

Takeda Oncology is working to discover and develop innovative new therapies that will make a difference in patients' lives.

The molecules in our development pipeline are ordered by their phase in the clinical development process, and within each phase molecules are ordered alphabetically. Phase 1 trials are conducted to determine proper dosing, while Phase 2 and 3 Studies determine the efficacy, side effects and safety of the therapies being researched.

Certain molecules may be under study for more than one disease area. Click on the arrows to learn more about each one.
